

Exercise 3: CSS

Maria Eduarda Kawakami Moreira - 11218751

2. What is the difference between margin and padding?

Margin is the space outside the element border, the padding is the space inside the element border. So let's say we have two elements, and we add a padding to both of them. The space between each element won't change because we didn't change the margin.

3. What is the correct way to specify values for the 4 different sides for padding?

There are two ways of doing it:

You can use padding-left, padding-right, padding-top, padding-bottom and assign a number for each one of them.

Or you can use, for example, padding: 10px 20px 10px 20px (which is top, right, bottom, left).

4. Assuming that multiple elements in an HTML page belong to the classes `btn` and `green`.

What is the correct selector to apply a style only to elements from both classes?

`.btn.green {}`
